Inside Scope:

- Processing which fields are requested
- Generating files in the requested format
- Verifying the requested data integrity is valid
- Serving the files to the user.

Outside Scope:

- Authentication
- Permission management
- Logging moderation actions

Primary Actor: Radio station manager.

Supporting Actors: IT, University staff, individual DJs.

Goal: To acquire usage statistics from the system.

Preconditions: User can authenticate and has permissions to access the content.

Postconditions: System logs the request, result, information regarding the request, and serves the user the statistics.

Success Scenario: The user is able to download the statistics as requested.

Step #	User	System
1	User selects the fields to export	System marks the requested fields to return
2	User selects a format to export the statistics in	System verifies that the format is a valid option
3	User notes reason for requesting data	The system collects the data as requested, generates the

		file in the selected format, and saves the file
4	User downloads the statistics	The system serves the file to the user

Alternative Scenarios:

- 1a. Data integrity is invalid: Notify the user that a selected field cannot be verified as accurate and refuse to serve. The system should log this failure and notify its support team for further investigation. Return to step 1.

Exception Scenarios:

- If the user loses connection to the server, store the processed file in temporary storage and let the user retry at a later time.
- If the server doesn't have the requested data, notify the user that the data is unavailable and to try again later.
- If the server does not support the requested file format, notify the user that the file format is not supported and to try another file format.
- If the data integrity for a field is invalid, notify the user that a selected field cannot be verified as accurate and notify the user to contact their support team. The system should log this failure and also notify its support team for further investigation, in case the user does not.

Business Rules:

- System must format data as selected by the user if the format is valid.
- System must allow the user to select which fields they desire or all fields.

- System must only return data related to platform usage, not identifiable information.

Quality Rules:

- Consistency: Do not return invalid or corrupted data.
- Consistency: Do not return stale data.
